

CMC implements systems that help our customers become more efficient. CMC creates a virtual world of your facility and/or data center.

Why create a virtual model? So...

- Facilities managers
- IT managers
- Safety officers
- Emergency responders
- Process managers
- Energy managers
- Construction planners
- Maintenance staff

...may be granted access to vital information from any location at a moments notice.

Imagine the possibilities of having a simple to use, common communication medium that a local or global team of troubleshooters or planners can simultaneously access in order to consult on an important facility, IT, process or safety issue.

Access the system to find operation manuals, trace a process, or isolate a circuit. Gain the ability to analyze physical infrastructure information prior to deploying or moving an IT server.

Let CMC analyze your infrastructure to tailor an efficiency tool for you.

*“Providing and Implementing Solutions  
for the Information Age”*

## ORGANIZATION

*“Efficient management begins with organizing the process.”*

Facility or data center infrastructure documentation and systems can rapidly become so disorganized that finding a starting point for organizing them becomes overwhelming.

CMC deploys at your facility, working to digitally record and organize your systems' assets, doing the work that needs to be done, but for which you seldom have time.

From your physical plant, (entry switchgear to roof top air conditioners) to your data center, (from UPS power to network cabling), all organized and digitally mapped on secure servers.

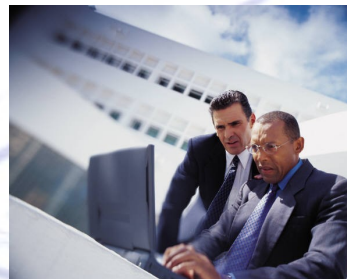

CMC creates a virtual world of your physical infrastructure, organizing information and systems in a format that is easy to use and access. Working from no prints, paper prints or existing AutoCAD, CMC organizes the process of facility efficiency.

## ACCESSIBILITY

*“Once a process is established, data can be gathered and measured and then the process can be improved.”*

CMC installs systems that can be accessed on-site as well as half-a-world away. As long as the internet can be accessed you have the ability to isolated circuits - whether they are electrical, plumbing or IT cabling. You can approve a new server install, or check the model and serial number of a boiler room pump; it's all at your fingertips.

An interactive virtual representation of your facility allows you or a team, to access critical information anytime, anywhere. Since the information is presented in an easy to understand model, it can be shared across disciplines; maintenance, security, IT, construction and emergency responders. You control the level of secure access.

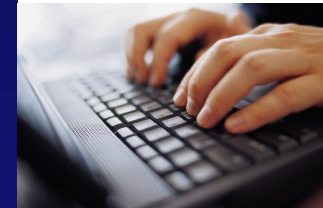

## MANAGEABILITY

*“A process is only as good as the quality of information on which it relies.”*

The ability to have up-to-date, critical information is vital in an information driven environment.

No one wants a system that is unnatural to the typical flow of work. They want a system that works for them, without filling out batches of endless databases.

CMC provides systems that are used in the day-to-day operation of a facility or data center, so the information is updated as the physical work is performed.

Our easy to maintain, click and drag system, allows you to stay current on adds, moves and changes. And because the system digitally mimics your facility or data center, it is easy to recognize and use. So if an emergency should arise, the ability to use the information comes as natural as performing a common everyday task.
